AB The introduction of human immunodeficiency virus type 1 (HIV-1) protease inhibitors (PIs) markedly improved the clin. outcome and control of HIV-1 infection. However, cross-resistance among PIs due to a wide spectrum of mutations in viral protease is a major factor limiting their broader

clin. use. Here we report on the suppression of PI resistance using a covalent attachment of a phosphonic acid motif to a peptidomimetic inhibitor scaffold. The resulting phosphonate analogs maintain high binding affinity to HIV-1 protease, potent antiretroviral activity, and unlike

the parent mols., display no loss of potency against a panel of clin. important PI-resistant HIV-1 strains. As shown by crystallog. anal., the phosphonate moiety is highly exposed to solvent with no discernable interactions with any of the enzyme active site or surface residues. We term this effect "solvent anchoring" and demonstrate that it is driven by a favorable change in the inhibitor binding entropy upon the interaction with mutant enzymes. This type of thermodyn. behavior, which was not

found with the parent scaffold fully buried in the enzyme active site, is a result of the increased degeneracy of inhibitor binding states, allowing effective mol. adaptation to the expanded cavity volume of mutant proteases.

This strategy, which is applicable to various PI scaffolds, should facilitate the design of novel PIs and potentially other antiviral therapeutics.

 AB The present invention is directed to use of electrospinning, i.e. the process of making polymer nanofibers from either a solution or melt under elec. forces, to prepare stable, solid dispersions of amorphous drugs in polymer nanofibers. The present invention is also directed to the process of making solid dispersions of amorphous forms and compns. of rosiglitazone and its pharmaceutically acceptable salts. A 3.1 weight% solution of rosiglitazone mesylate 2-PrOH-water was spray dried to give an amorphous powder.

AB A novel series of P1 modified HIV protease inhibitors was synthesized and evaluated for in vitro antiviral activity against wild-type virus and protease inhibitor-resistant viruses. Optimization of the P1 moiety resulted in compds. with femtomolar enzyme activities and cellular antiviral activities in the low nanomolar range culminating in the identification of clin. candidate GW0385.

AB The invention relates to phosphonate-substituted carbamates I and cyclic ureas II [wherein A = A1, A2, or W3 with the proviso that at least one of A = A1; A1 = [Y2(CR2R2)1-12]O-12Y2W3; A2 = [Y2(CR2R2)1-12]O-12Y2W3; W3 =

Y1, Rx, N(Rx)2, SO-2Rx, substituted alkyl, alkenyl, alkynyl, etc.; R3 = halo, CN, N3, NO2, Y1, Rx, N(Rx)2, SRx, SO2Rx, OC(Y1)Rx, OC(Y1)ORx, C(Y1)Rx, etc. with provisos; R5 = substituted alkyl, alkenyl, or alkynyl; or pharmaceutically acceptable salts, hydrates, and formulations thereof and other phosphonate-substituted analogs of HIV protease inhibitors for treating AIDS and other antiviral infections, as well as for use in

assays for the detection of HIV protease. Comps. of the invention inhibit reverse transcriptase activity and have improved intracellular half-life compared to analogs not having the phosphonate or phosphonate prodrug. Libraries of such comps. were screened optionally using the novel enzyme GS-7340 ester hydrolase. Comps. and methods relating to GS-7340 ester hydrolase also are provided. Examples include preps. for non-nucleoside phosphonate protease inhibitors. In addn., extensive biol. data

regarding PMMC uptake and metab., serum stability, and alk. phosphatase protease inhibitor (ALPPI) activity of selected phosphonate-substituted prodrugs

is presented. For instance, a 9-step reaction sequence starting from N-tert-butoxycarbonyl-O-benzyl-L-tyrosine provided III (K_i ≤10 pM for ALPPI activity). The synthesis involved multiple protection and deprotection steps along with coupling reactions using isobutylamine, (3R,3aR,6aR)-hexahydrofuro[2,3-b]furan-2-yl 4-nitrophenyl carbonate, and dibenzyl hydroxymethylphosphonate.

AB Furanofuryl analogs of the HIV protease inhibitor amprenavir such as I are prepared in which a terminally substituted n-alkyl group is appended to the N-iso-Bu group of amprenavir and in which the substituents on the N-arylsulfonyl moiety are varied. Some of the inhibitors such as I are found to have greatly enhanced inhibition of HIV protease; the amprenavir analogs also inhibit the growth of both wild-type and resistant strains of HIV and are more effective against the HIV strains than the currently marketed HIV protease inhibitors amprenavir, indinavir, and nelfinavir. E.g., I inhibits wild-type HIV protease with a K_i value of 0.014 μ M, and inhibits wild-type and resistant strains of HIV with IC_{50} values of between 1.6 nM and 15 nM.

AB The present invention is directed to the field of nucleic acid diagnostics and the identification of base variation in target nucleic acid sequences.

More particularly, the present invention relates to the use of such genotypic characterization of a target population of HIV and the subsequent association, i.e., correlation, of this information to phenotypic interpretation in order to correlate virus mutational profiles with drug resistance. The invention also relates to methods of utilizing the mutational profiles of the invention in drug development, i.e., drug discovery, drug design, drug modification, and therapy, treatment design, clin. management and diagnostic anal.

for the detection of HIV protease. Comps. of the invention inhibit reverse transcriptase activity and have improved intracellular half-life compared to analogs not having the phosphonate or phosphonate prodrug. Libraries of such comps. were screened optionally using the novel enzyme GS-7340 ester hydrolase. Comps. and methods relating to GS-7340 ester hydrolase also are provided. Examples include preps. for non-nucleoside phosphonate protease inhibitors. In addn., extensive biol. data

regarding

PBMC uptake and metab., serum stability, and alk. phosphatase protease inhibitor (ALPPI) activity of selected phosphonate-substituted prodrugs

is presented. For instance, a 9-step reaction sequence starting from N-tert-butoxycarbonyl-O-benzyl-L-tyrosine provided III (K_i ≤10 pM for ALPPI activity). The synthesis involved multiple protection and deprotection steps along with coupling reactions using isobutylamine, (3R,3aR,6aS)-hexahydrofuro[2,3-b]furan-2-yl 4-nitrophenyl carbonate, and dibenzyl hydroxymethylphosphonate.

AB The invention relates to phosphonate-substituted carbamates I and cyclic ureas II (wherein A = Al, A2, or W3 with the proviso that at least one of A = Al; A1 = {Y2(CR2R2)1-12}0-12Y2W6; A2 = {Y2(CR2R2)1-12}0-12Y2W3; W3 = substituted (hetero)cyclyl, R5, C(Y1)R5, C(Y1)W5, SO2R5, or SO2W5; W5 = substituted (hetero)cyclyl; W6 = triphosphono-substituted W3; Y1 = O, S, N(Rx), N(O)(Rx), N(ORx), N(O)(ORx), or N(N(Rx)2); Y2 = independently a bond, O, N(Rx), N(O)(Rx), N(ORx), N(O)(ORx), N(N(Rx)2), SOO-2, or SOO-2SOO-2; Rx = independently H, R1, W3, a protecting group, etc.; R1 = independently H or alkyl; R2 = independently H, R1, halo, CN, N3, NO2, Y1, RX, N(Rx)2, SO-2RX, substituted alkyl, alkenyl, alkynyl, etc.; R3 = halo, CN, N3, NO2, Y1, RX, N(Rx)2, SRX, SO2RX, OC(Y1)RX, OC(Y1)ORX, C(Y1)RX, etc. with provisos; R5 = substituted alkyl, alkenyl, or alkynyl; or pharmaceutically acceptable salts, hydrates, and formulations thereof] and other phosphonate-substituted analogs of HIV protease inhibitors for treating AIDS and other antiviral infections, as well as for use in assays for the detection of HIV protease. Comps. of the invention inhibit reverse transcriptase activity and have improved intracellular half-life compared to analogs not having the phosphonate or phosphonate prodrug. Libraries of such comps. were screened optionally using the novel enzyme GS-7340 ester hydrolase. Comps. and methods relating to GS-7340 ester hydrolase also are provided. Examples include preps. for non-nucleoside phosphonate protease inhibitors. In addition, extensive biol. data regarding PBMC uptake and metabolism, serum stability, and alkaline phosphatase inhibitor (ALPPI) activity of selected phosphonate-substituted prodrugs is presented. For instance, a 9-step reaction sequence starting from N-tert-butoxycarbonyl-O-benzyl-L-tyrosine provided III (K1 s10 pH for ALPPI activity). The synthesis involved multiple protection and deprotection steps along with coupling reactions using isobutylamine, (3R,3aR,6aS)-hexahydrofuro[2,3-b]furan-2-yl 4-nitrophenyl carbonate, and dibenzyl hydroxymethylphosphonate.

AB The present invention relates to pharmaceutical formulations of (3R,3aS,6aR)-hexahydrofuro[2,3-b]furan-3-yl (1S,2R)-3-[[[4-(aminophenyl)sulfonyl](isobutyl)amino]-1-benzyl-2-hydroxypropyl]carbamate (I), salts, esters, polymorphic and pseudopolymorphic forms thereof, which are self-microemulsifying drug delivery systems and comprise as carrier a lipophilic phase, one or more surfactants, a hydrophilic solvent and a nucleation inhibitor. A self-microencapsulating system for hard gelatin capsules comprised I ethanolate, Cremophor RH40, FVP, and diethylene glycol monoethyl ether.

 AB A novel series of tyrosine-derived HIV protease inhibitors was synthesized and evaluated for in vitro antiviral activity against wild-type virus and two protease inhibitor-resistant viruses. All of the compds. had wild-type antiviral activities that were similar to or greater than several currently marketed HIV protease inhibitors. In addition, a number of compds. in this series were more potent against the drug-resistant mutant viruses than they were against wild-type virus.

AB The present invention includes identification of enzymes responsible for prodrug activation and their utilization in the identification of candidate compds. as prodrugs. Methods for identifying a candidate compound as a suitable prodrug as well as methods of screening candidate compds. for suitability as therapeutic agents are presented. The methods are especially useful for screening inhibitors of e.g. GS-9005 ester hydrolase A, hydrolase GS-7340, HIV protease, HIV integrase or HIV reverse transcriptase to screen for HIV, inflammation and cancer therapeutics.

AB By the present invention, enzymes responsible for prodrug activation are identified and utilized for the identification of candidate compds. as prodrugs. The present invention includes methods for identifying a candidate compound as a suitable prodrug as well as methods of screening candidate compds. for suitability as therapeutic agents. The methods are especially useful for screening inhibitors of e.g. GS-9005 ester hydrolase A, prolylcarboxypeptidase, HIV protease, HIV integrase or HIV reverse transcriptase.

L7 ANSWER 16 OF 51 CAPLUS COPYRIGHT 2007 ACS on STN (Continued)

AB Aminohydroxypropyl benzoxazolesulfonamides I [E = electrophilic moiety;
PG = protecting group; R2 = H, alkyl; R3 = (un)substituted cycloalkyl, aryl, heteroaryl, alkyl; R4 = H, HO2C, (un)substituted alkyl, alkoxy carbonyl, aminocarbonyl, cycloalkyl, alkenyl, alkynyl] such as II (R5 = MeS; R6 = Me3C) are prepared as intermediates in the synthesis of HIV protease inhibitors such as II (R5 = H2N; R6 = 5-thiazolylmethyl). S-alkylation

of 2-benzoxazolethione followed by regioselective sulfonylation yields an benzoxazolesulfonic acid derivative which sulfonylates an amino alc. (derived from ring opening of an epoxide with an amine) to provide I. For example, 2-mercaptobenzoxazole is methylated and the product regioselectively sulfonylated with chlorosulfonic acid and converted to the sulfonyl chloride with thionyl chloride to yield 2-(methylthio)-6-benzoxazolesulfonyl chloride. Ring opening of (1-(Boc-amino)-2-phenylethyl)oxirane (Boc = Me3COCO) with isobutylamine yields the amine PhCH2CH(NHBoc)CH(OH)CH2NHCH2CHMe2 (III). Sulfonylation of III with 2-(methylthio)-6-benzoxazolesulfonyl chloride provides II (R5 = MeS; R6 = Me3C). Heating of II (R5 = MeS; R6 = Me3C) with ammonia under pressure, cleavage of the Boc group with hydrogen chloride in isopropanol, and treatment with mono(N-hydroxysuccinimidyl) mono(5-thiazolylmethyl) carbonate yields II (R5 = H2N; R6 = 5-thiazolylmethyl).

 AB A capillary electrophoretic (CE) method was developed for the separation of

diastereoisomers of a new human immunodeficiency virus (HIV) protease inhibitor TMC114. In total 16 isomers of this drug were synthesized (8 pairs of enantiomers). The authors succeeded in the separation of the 8 diastereoisomers, but no enantiomers could be separated. Because of the

high similarity and water-insolubility of these isomers, the separation is a real challenge. Different CE modes were tried out: capillary zone electrophoresis (CZE), nonaqueous capillary electrophoresis (NACE), micellar electrokinetic capillary chromatography (MEKC), and microemulsion electrokinetic capillary chromatography (MEEKC). Only MEEKC offered resolution of these compounds.

AB The invention provides new prodrugs which are conjugates of a therapeutic compound and a peptide which are cleavable by dipeptidyl-peptidases, preferably by CD26, also known as DPP-IV (dipeptidyl aminopeptidase IV). Prodrugs I [n is 1-5; Y is proline, alanine, hydroxyproline, dihydroxyproline, thiazolidinecarboxylic acid (thioprolin), dehydroproline, pipecolic acid (L-homoproline), azetidinecarboxylic acid, aziridinecarboxylic acid, glycine, serine, valine, leucine, isoleucine or threonine; X is a D- or L-amino acid; X and Y in each repeat of [Y-X] are chosen independently from one another and independently from other repeats; Z is a direct bond or a bivalent straight or branched saturated hydrocarbon group having from 1 to 4 carbon atoms; R1 is aryl, heteroaryl, arylalkoxy, heteroarylalkoxy, heterocycloalkoxy, heteroarylalkoxy; R2 is arylalkyl; R3 is alkyl, alkenyl or cycloalkylalkyl; R4 is H or alkyl and their stereoisomeric forms and salts are claimed. Thus, peptide conjugate II (Val-Pro-PI 1) was prepared via peptide coupling reaction and studied biol., e.g., its conversion to the parent drug PI 1 in human or bovine serum.

AB The invention provides new prodrug technol. and prodrugs in order to increase solubility, modulate plasma protein binding or enhance the bioavailability of a drug. The prodrugs are conjugates of a therapeutic compound and a peptide (e.g., a tetra- or hexapeptide) which are cleavable by dipeptidyl-peptidases, preferably by CD26, also known as DPPIV (dipeptidyl aminopeptidase IV). Claimed prodrugs comprise a therapeutic compound linked via an amide bond to an oligopeptide H-(X-Y)_n, where X is an amino acid, n is 1-5, and Y is an amino acid selected from the group consisting of proline, alanine, hydroxyproline, dihydroxyproline, thiazolidinecarboxylic acid (thioprolin), dehydroproline, pipecolic acid (L-homoproline), azetidinecarboxylic acid, aziridinecarboxylic acid, glycine, serine, valine, leucine, isoleucine and threonine. Thus, Val-Pro-NAP-TSAO, the dipeptide conjugate of the antiviral prodrug NAP-TSAO, was prepared and studied biol., e.g., its conversion to the parent drug in human or bovine serum!

AB The arylsulfonamide derivs. described herein were such potent inhibitors of human immunodeficiency virus type 1 (HIV-1) protease (enzyme, E) that values for the inhibition consts. (K_i) could not be determined by

conventional steady-state kinetic techniques (i.e., the minimal enzyme concentration usable for the activity assay was much greater than the value of the

dissociation constant). Consequently, two alternative methods were developed for estimation of K_i values. The first method employed kinetic detns. of values for k₁and k₋₁, from which K_i was determined (k₋₁/k₁). The second method was a competitive displacement assay used to determine binding affinities of

other inhibitors relative to that of GW0385. In these assays, the inhibitor of unknown affinity was used to displace [3H]GW0385 from E·[3H]GW0385. From the concentration of E·[3H]GW0385 at equilibrium, the concns. of

enzyme-bound and free inhibitors were calculated, and the ratio of the K_i value of the unknown to that of GW0385 was determined (K_i,unknown/K_i,GW0385).The values of k₁ were calculated from data in which changes in the intrinsic protein fluorescence of the enzyme associated with inhibitor binding were

directly or indirectly monitored. In the case of saquinavir, the fluorescence changes associated with complex formation were large enough

to monitor directly. The value of k₁ for saquinavir was 62±2 μM⁻¹ s⁻¹. In the case of GW0385, the fluorescence changes associated with complexformation were too small to monitor directly. Consequently, the value of k₁ was estimated from a competition experiment in which the effect ofGW0385 on the binding of E to saquinavir was determined. The value of k₁ for GW0385 was estimated from these expts. to be 137±4 μM⁻¹ s⁻¹. Because E·[3H]GW0385

was stable in the standard buffer at room temperature for greater than 33 days, the value of the first-order rate constant for dissociation of E·[3H]GW0385

(k₋₁) could be estimated from the time-course for exchange of E·[3H]GW0385 with excess unlabeled GW0385. The value of k₋₁ calculated from these data was (2.1±0.1) × 10⁻⁶ s⁻¹ (t_{1/2} = 91 h). The K_ivalue of wild-type HIV-1 protease for GW0385, calculated from these values for k₁ and k₋₁, was 15±1 nM. Three multidrug resistant enzymes had K_i

values for GW0385 that were less than 5 μM. IT 810687-58-2

 AB The screening of known HIV-1 protease inhibitors against a panel of multidrug-resistant viruses revealed the potent activity of TMC126 on drug-resistant mutants. In comparison to amprenavir, the improved affinity of TMC126 is largely the result of one extra hydrogen bond to the backbone of the protein in the P2 pocket. Modification of the substitution pattern on the phenylsulfonamide P2' substituent of TMC126 created an interesting SAR, with the close analog TMC114 being found to have a similar antiviral activity against the mutant and the wild-type viruses. X-ray and thermodynamic studies on both wild-type and mutant enzymes showed an extremely high enthalpy driven affinity of TMC114 for HIV-1 protease. In vitro selection of mutants resistant to TMC114 starting from wild-type virus proved to be extremely difficult; this was not the case for other close analogs. Therefore, the extra H-bond to the backbone in the P2 pocket cannot be the only explanation for the interesting antiviral profile of TMC114. Absorption studies in animals indicated that TMC114 has pharmacokinetic properties comparable to currently approved HIV-1 protease inhibitors.

 AB Method development of enantiomeric sepns. in capillary electrophoresis (CE) is a time-consuming task, since finding the appropriate chiral selector is usually a "trial and error" process. It is impossible to predict the selectivity of a selector towards a certain enantiomer. Therefore, the affinity of all selectors has to be examined one at a time.
 In order to speed up this process, a strategy is proposed based on simple exptl. design methodol. The approach includes first a screening in function of the pH to determine the optimal migration conditions followed by a selection of the right chiral selector by means of Taguchi designs. In the approach several variables, such as the type and concentration of cyclodextrin, the concentration of buffer electrolyte, and the percentage of organic modifier, are varied simultaneously to find initial separation conditions rapidly. The resulting initial separation conditions can be optimized in further steps to be more reproducible. We discuss the results of the approach when applied on a number of selected compds. that are recently in development at Johnson & Johnson - Pharmaceutical Research and Development. Parameters, such as quality of the separation and anal. time, are evaluated to determine initial separation conditions for each compound

It further relates to their use as broad spectrum HIV protease inhibitors, pharmaceutical compns., and a method

for treating or combating infection or disease associated with multi-drug resistant retrovirus infection in a mammal. It also may concern combinations thereof with another anti-retroviral agent, and to their use in assays as reference compds. or as reagents. These compds. I exhibited potent anti-HIV activity against a wild type laboratory HIV strain (HIV-1 strain

L-AI), e.g. sec50 of 8.5 for the compound (II), and also were effective

in inhibiting a broad range of mutant strains which show various degrees of phenotypic cross-resistance to the currently com. available drugs such as for instance saquinavir, ritonavir, nelfinavir, indinavir and amprevir.

AB The present invention is directed to use of electrospinning, i.e. the process of making polymer nanofibers from either a solution or melt under elec. forces, to prepare stable, solid dispersions of amorphous drugs in polymer nanofibers. Thus, carvedilol-HBr monohydrate was dissolved in THF and water. The solution was added to Polyox WSR1105 in MeCN solution

This solution was spun to give nanofibers, and the morphol. of the drug was shown to be amorphous.

AB The invention relates to phosphonate-substituted carbamates I and cyclic ureas II [wherein A = Al, A2, or W3 with the proviso that at least one of A = Al; A1 = [Y2(CR2R2)1-12]0-12Y2W6; A2 = [Y2(CR2R2)1-12]0-12Y2W3; W3 = substituted (hetero)cyclyl; R5, C(Y1)R5, C(Y1)W5, SO2R5, or SO2W5; W5 = substituted (hetero)cyclyl; W6 = triphosphono-substituted W3; Y1 = O, S, N(Rx), N(O)(Rx), N(ORx), N(O)(ORx), or N(N(Rx)2); Y2 = independently a bond, O, N(Rx), N(O)(Rx), N(ORx), N(O)(ORx), N(N(Rx)2), SOO-2, or SOO-2SOO-2; Rx = independently H, R1, W3, a protecting group, etc.; R1 = independently H or alkyl; R2 = independently H, R1, halo, CN, N3, NO2, Y1, Rx, N(Rx)2, SO-2Rx, substituted alkyl, alkenyl, alkynyl, etc.; R3 = halo, CN, N3, NO2, Y1, Rx, N(Rx)2, SRx, SO2Rx, OC(Y1)Rx, OC(Y1)ORx, C(Y1)Rx, etc. with provisos; R5 = substituted alkyl, alkenyl, or alkynyl; or pharmaceutically acceptable salts, hydrates, and formulations thereof] and other phosphonate-substituted analogs of HIV protease inhibitors for

treating AIDS and other antiviral infections, as well as for use in assays

for the detection of HIV protease. Comps. of the invention inhibit reverse transcriptase activity and have improved intracellular half-life compared to analogs not having the phosphonate or phosphonate prodrug. Examples include preps. for non-nucleoside saquinavir-like, lopinavir-like, ritonavir-like, indinavir-like, atazanavir-like, nelfinavir-like, tipranavir-like, amprenavir-like, KNI-like, and cyclic carbonyl-like phosphonate protease inhibitors. In addn., extensive biol. data regarding PPMC uptake and metab., serum stability, and alk. phosphatase protease inhibitor (ALPPI) activity of selected phosphonate-substituted prodrugs is presented. For instance, a 9-step reaction sequence starting from N-tert-butoxycarbonyl-O-benzyl-L-tyrosine provided III (K_i ≤10 pM for ALPPI activity). The synthesis involved multiple protection and deprotection steps along with coupling reactions using isobutylamine,

was treated with 4-NCC6H4SO2Cl to give (1S,2R)-
Me3CO2CNHCH(CH2Ph)CH(OH)CH2N(CH2CHMe2)SO2C6H4CN-4 which was deblocked and
treated with the hexahydrofurofuran-2-ylideneoxycarbonylpyrrolidinedione to
give the carbamate I [R6 = CN]. Treatment of I [R6 = CN] with NH2OH.HCl
gave I [R6 = C(NH2).NOH] which was cyclized with 2-furoyl chloride to

give I [R6 = 5-(2-furyl)-1,2,4-oxadiazol-3-yl] which had pEC50 = 8.4 for
inhibition of HIV-1.

The compds. can also be combined with another anti-retroviral agent, and be used in assays as reference compds. or as reagents. Thus, II was prepared, and was effective in inhibiting a broad range of mutant strains in a cellular assay.

AB The present invention relates to novel bis-tetrahydrofuran benzodioxolyl sulfonamide compds. (I) and its stereoisomers which are surprisingly effective protease inhibitors. The invention also relates to pharmaceutical compns., methods of inhibiting retrovirus proteases, in particular multidrug resistant retrovirus proteases, methods of treating or combating infection or disease associated with retrovirus infection

in a mammal, and methods of inhibiting viral replication. I and its stereoisomer (II) were tested against 17 HIV-1 strains and showed IC50 of 0.0014 and 0.0008 μ M, resp., against HIV-1 LAI strain in MT4 cells.

L7 ANSWER 43 OF 51 CAPLUS COPYRIGHT 2007 ACS on STN (Continued)

AB The title arylsulfonamides, namely (3R,3aS,6aR)-hexahydrofuro[2,3-b]furan-3-yl 3-arylsulfonylamino-1-(4-hydroxyphenyl)-2-hydroxypropylcarbamate derivs. (e.g. I) are prepared. These compds. are particularly well suited for inhibiting HIV-1 and HIV-2 protease activity and consequently, may be advantageously used as anti-viral agents against the HIV-1 and HIV-2 viruses. They are useful for treating with a patient diagnosed with

AIDS, AIDS related complex (ARC), progressive generalized lymphadenopathy (PGL), Kaposi's sarcoma, thrombocytopenic purpura, or AIDS-related neuropathies such as AIDS dementia complex, multiple sclerosis or tropical paresis, etc. Thus, (3R,3aS,6aR)-hexahydrofuro[2,3-b]furan-3-yl

3-[N-(1,3-benzodioxol-5-ylsulfonyl)-N-isobutylamino]-1-(4-hydroxyphenyl)-2-hydroxypropylcarbamate underwent Mitsunobu reaction with phenethyl alc. using Ph3P and di-tert-Bu azodicarbonate in CH₂Cl₂ at room temperature for 1.5 h to give 72% I. I showed IC₅₀ of <0.001, <0.001, and 0.01-0.001 μM against drug-resistant HIV strains, i.e. wild type, mutant HIV-1 EP13, and mutant D545701-14 HIV strains, resp., in MT-4 cells.

Thus, 3-NO2C6H4SO2Cl was added to tert-Bu (1S,2R)-N-[(1-benzyl-3-[(4-cyano-2,2-dimethylbutyl)amino]-2-hydroxypropyl)carbamate (preparation given) to form the 3-nitrophenylsulfonamide (55%). Reduction to the 3-aminophenylsulfonamide (85%), followed by transesterification with [(3S,3aR,6aS)-hexahydrofuro[2,3-b]furan-3-yl] (4-nitrophenyl)carbonate (65%), gave I.

In

an antiviral activity assay, I inhibited HIV-1 protease in the MT4 cell line with Ki < 1 nM and IC50 < 0.1 μM.

AB The invention provides an assay for determining the biochem. fitness of a biochem. species in a mutant replicating biol. entity relative to its predecessor. The invention further provides a continuous fluorogenic assay for measuring the anti-HIV protease activity of protease inhibitor. The invention also provides a method of administering a therapeutic compound that reduces the chances of the emergence of drug resistance in therapy.

The invention also provides a compound

Also provided are pharmaceutical

comps. for, and therapeutic methods of treating a multidrug-resistant retroviral infection in a mammal. For example, azidoepoxybutane II (4-step

preparation from butadiene monooxide and PhMgBr given) was subjected to ring cleavage/amination with Me₂CHCH₂NH₂, the amine amidated with p-MeOC₆H₄SO₂Cl and the azide function of the resulting amide reduced by Pd-catalyzed hydrogenation to give aminosulfonamide III. Transamidation of the latter with (3R,3aS,6aR)-3-hydroxyhexahydrofuro[2,3-b]furyl succinimidyl carbonate (5-step preparation from dihydrofuran and propargyl alc.

given) gave a title inhibitor IV which showed nanomolar and sub-nanomolar potency against several multidrug-resistant HIV-1.

 AB A combination of structure-based design and both solution, and solid-phase synthesis were utilized to derive a potent (nanomolar) series of HIV-1 protease inhibitors bearing a structurally novel backbone. Detailed structural anal. of several inhibitors prepared in this series has suggested that rigidification of the P1/P2 region of this class of mols. may result in compds. with improved potency.

AB The human immunodeficiency virus type 1 (HIV-1) protease inhibitor UIC-PI (I) was developed via structure-based design and incorporated a novel bis-tetrahydrofuran (bis-THF) ligand in the (R)-(hydroxyethyl)sulfonamide based isostere. The EC50 and EC90 of the compound in acutely-infected H9 cells were <1 and .apprx.1 nM, resp. In chronically infected H9/HIV-1IIB cells, the EC50 and EC90 were 20 and 50 nM, resp. In parallel studies comparing UIC-PI and saquinavir in H9/HIV-1IIB cells, viral p24 levels in culture supernatants were an order of magnitude lower with UIC-PI than with saquinavir.

 AB We identified UIC-94003, a nonpeptidic human immunodeficiency virus (HIV) protease inhibitor (PI), containing 3(R), 3a(S), 6a(R)-bis-tetrahydrofuran-yl urethane (bis-THF) and a sulfonamide isostere, which is extremely potent against a wide spectrum of HIV (50% inhibitory concentration, 0.0003 to 0.0005 μM). UIC-94003 was also potent against multi-PI-resistant HIV-1 strains isolated from patients who had no response to any existing antiretroviral regimens after having received a variety of antiretroviral agents (50% inhibitory concentration, 0.0005 to 0.0055 μM). Upon selection of HIV-1 in the presence of UIC-94003, mutants carrying a novel active-site mutation, A28S, in the presence of L10F, M46I, I50V, A71V, and N88D appeared. Modeling anal. revealed that the close contact of UIC-94003 with the main chains of the protease active-site amino acids (Asp29 and Asp30) differed from that of other PIs and may be important for its potency and wide-spectrum activity against a variety of drug-resistant HIV-1 variants. Thus, introduction of inhibitor interactions with the main chains of key amino acids and seeking a unique inhibitor-enzyme contact profile should provide a framework for developing novel PIs for treating patients harboring multi-PI-resistant HIV-1.

 AB We designed, synthesized, and identified UIC-94017 (TMC114), a novel nonpeptidic human immunodeficiency virus type 1 (HIV-1) protease inhibitor (PI) containing a 3(R),3a(S),6a(R)-bis-tetrahydrofuranylethane (bis-THF) and a sulfonamide isostere which is extremely potent against laboratory HIV-1 strains and primary clin. isolates (50% inhibitory concentration [IC50], approx. 0.003 µM; IC90, approx. 0.009 µM) with minimal cytotoxicity (50% cytotoxic concentration for CD4+ MT-2 cells, 74 µM). UIC-94017 blocked the infectivity and replication of each of HIV-1NL4-3 variants exposed to and selected for resistance to saquinavir, indinavir, nelfinavir, or ritonavir at concns. up to 5 µM (IC50s, 0.003 to 0.029 µM), although it was less active against HIV-1NL4-3 variants selected for resistance to amprenavir (IC50, 0.22 µM). UIC-94017 was also potent against multi-PI-resistant clin. HIV-1 variants isolated from patients who had no response to existing antiviral regimens after having received a variety of antiviral agents. Structural analyses revealed that the close contact of UIC-94017 with the main chains of the protease active-site amino acids (Asp-29 and Asp-30) is important for its potency and wide spectrum of activity against multi-PI-resistant HIV-1 variants. Considering the favorable pharmacokinetics of UIC-94017 when administered with ritonavir, the present data warrant that UIC-94017 be further developed as a potential therapeutic agent for the treatment of primary and multi-PI-resistant HIV-1 infections.

AB A review. Despite the availability of 16 antiretroviral drugs approved for the treatment of HIV infection, current combination regimens present challenges. Newer antiretroviral drugs are needed to improve convenience, reduce toxicity and, of particular importance, to provide antiretroviral activity against viral strains resistant to the currently available antiretroviral agents. Candidate drugs with novel properties are in development in the two currently available drug classes: HIV reverse transcriptase inhibitors (nucleoside analogs, non-nucleoside analogs and nucleotide analogs) and HIV protease inhibitors (PI). Investigational nucleoside analog reverse transcriptase inhibitors (NRTI) include emtricitabine (FTC) and amdoxovir (DAPD), and investigational non-nucleoside reverse transcriptase inhibitors (NNRTI) include DPC 083 and TMC 125. New protease inhibitors under investigation include atazanavir (BMS-232 632), tipranavir, and TMC 114. In addition, newer agents with novel mechanisms of action such as HIV entry inhibitors (that inhibit the three steps of HIV entry: CD4 attachment, chemokine receptor binding and membrane fusion) and HIV integrase inhibitors are under investigation. Investigational entry inhibitors include PRO 542 (a CD4 attachment inhibitor), Schering C (a chemokine receptor inhibitor), enfuvirtide (T-20) and T-1249, inhibitors of membrane fusion. Investigational HIV integrase inhibitors include S-1360. Continued progress in the treatment of HIV disease will result from the development of new antiretroviral drugs.

 AB A review. Due to factors such as resistance and long-term side effects as well as dosing regimen-related adherence issues, HIV therapy is a constantly moving target. HIV-1 protease inhibitors had an immediate and dramatic impact on the outcome of HIV/AIDS when launched in late 1995, and the search for new and improved next generation mols. has been under way in many labs. At GlaxoSmithKline (GSK) and Vertex Pharmaceuticals, this effort focused on 2 key issues, patient compliance and viral resistance. Using a water-solubilizing prodrug approach, the pill burden in delivering a protease inhibitor, Amprenavir, was dramatically decreased. By eliminating the large amts. of excipients necessary for the original soft-gel formulation, Fosamprenavir (Lexiva/Telzir) delivers the clin. efficacious dose of Amprenavir with 2 compact tablets per dose, compared to 8 gel capsules. The efforts to overcome viral resistance to 1st generation protease inhibitors by further elaborating the SAR of the Amprenavir and related scaffolds led to successive and dramatic improvements in wild-type antiviral potencies, and ultimately to the discovery of ultra-potent mols. with very favorable overall resistance profiles. The selection of GW640385 (Brecanavir - USAN approved only) as a clin. candidate and its progression into current phase 2 dose ranging studies represents the culmination of the effort toward the next generation protease inhibitors.

 AB Development of in vitro resistance to GW640385, a new human immunodeficiency virus type 1 protease inhibitor, was studied. Variants characterized included one with <4-fold resistance and amino acid substitutions Q58E/A71V (protease) and P452K (Gag) and one with >50-fold resistance and amino acid substitutions L106F/G168E/E21K/A28S/M46L/F53L/A71V (protease) and L499F/P453T (Gag). The A28S substitution substantially reduced replication capacity.

AB The arylsulfonamide deriva. described herein were such potent inhibitors of human immunodeficiency virus type 1 (HIV-1) protease (enzyme, E) that values for the inhibition consts. (K_i) could not be determined by

conventional steady-state kinetic techniques (i.e., the minimal enzyme concentration usable for the activity assay was much greater than the value of the

dissociation constant). Consequently, two alternative methods were developed for estimation of K_i values. The first method employed kinetic detns. of values for k₁ and k₋₁, from which K_i was determined (k₋₁/k₁). The second method was a competitive displacement assay used to determine binding affinities of

other inhibitors relative to that of GW0385. In these assays, the inhibitor of unknown affinity was used to displace [3H]GW0385 from E·[3H]GW0385. From the concentration of E·[3H]GW0385 at equilibrium, the concns. of enzyme-bound and free inhibitors were calculated, and the ratio of the K_i value of the unknown to that of GW0385 was determined (K_i,unknown/K_i,GW0385).

The values of k₁ were calculated from data in which changes in the intrinsic protein fluorescence of the enzyme associated with inhibitor binding were directly or indirectly monitored. In the case of saquinavir, the fluorescence changes associated with complex formation were large enough to monitor directly. The value of k₁ for saquinavir was 62±2 μM⁻¹ s⁻¹. In the case of GW0385, the fluorescence changes associated with complex formation were too small to monitor directly. Consequently, the value of k₁ was estimated from a competition experiment in which the effect of GW0385 on the binding of E to saquinavir was determined. The value of k₁ for GW0385 was estimated from these expts. to be 137±4 μM⁻¹ s⁻¹. Because E·[3H]GW0385 was stable in the standard buffer at room temperature for greater than 33 days, the value of the first-order rate constant for dissociation of E·[3H]GW0385 (k₋₁) could be estimated from the time-course for exchange of E·[3H]GW0385 with excess unlabeled GW0385. The value of k₋₁ calculated from these data was (2.1±0.1) × 10⁻⁶ s⁻¹ (t_{1/2} = 91 h). The K_i value of wild-type HIV-1 protease for GW0385, calculated from these values for k₁ and k₋₁, was 15±1 nM. Three multidrug resistant enzymes had K_i values for GW0385 that were less than 5 pM.

AB The present invention is directed to use of electrospinning, i.e. the process of making polymer nanofibers from either a solution or melt under elec. forces, to prepare stable, solid dispersions of amorphous drugs in polymer nanofibers. Thus, carvedilol-HBr monohydrate wa dissolved in THF and water. The solution was added to Polyox WSR1105 in MeCN solution

This solution was spun to give nanofibers, and the morphol. of the drug was shown to be amorphous.

These compds. are particularly well suited for inhibiting HIV-1 and HIV-2 protease activity and consequently, may be advantageously used as anti-viral agents against the HIV-1 and HIV-2 viruses. They are useful for treating with a patient diagnosed with

AIDS, AIDS related complex (ARC), progressive generalized lymphadenopathy (PGL), Kaposi's sarcoma, thrombocytopenic purpura, or AIDS-related neural conditions such as AIDS dementia complex, multiple sclerosis or tropical paraperesis, etc. Thus, (3R,3aS,6aR)-hexahydrofuro[2,3-b]furan-3-yl

AB An efficient synthesis of an HIV-1 protease inhibitor and its analogs, which incorporate the pyrrolidone scaffold 2 as P1-P2 moiety, was developed. Evaluation of these analogs in the HIV-1 protease enzyme assay resulted in the discovery of potent and more water soluble meta-amino- and meta-hydroxy inhibitors. The SAR observed in this class of PIs could be rationalized with aid of the X-ray structure of an inhibitor co-crystallized with the HIV-1 protease, which suggested that the polar meta- (but not para-) benzyl substituents in P2 could side-step the hydrophobic S2 enzyme active pocket by rotating the P2 moiety around its C β -C γ bond. Such reorientation allows to engage the unsubstituted, hydrophobic edge of benzyl moiety in P2 in the requisite P2/S2 hydrophobic interaction, and projects polar meta-substituent into the bound water. It appears that the meta-position can be chemical derivatized without potency loss of thus resulting inhibitors, as evidenced by potent deriva. Thus, pyrrolidone-based inhibitors were identified, which uniquely accommodate, both high enzyme potency and which provide a platform for fine-tuning of drug-like properties in this class of PIs by addnl. chemical manipulations on the meta-position. The mol. structure of HIV-1 protease complex with complex with 2,3,5-trideoxy-N-[(1S,2R)-2,3-dihydro-2-hydroxy-1H-inden-1-

AB The title arylsulfonamides, namely (3R,3aS,6aR)-hexahydrofuro[2,3-b]furan-3-yl 3-arylsulfonylamino-1-(4-hydroxyphenyl)-2-hydroxypropylcarbamate derivs. (e.g. I) are prepared. These compds. are particularly well suited for inhibiting HIV-1 and HIV-2 protease activity and consequently, may be advantageously used as anti-viral agents against the HIV-1 and HIV-2 viruses. They are useful for treating with a patient diagnosed with AIDS, AIDS related complex (ARC), progressive generalized lymphadenopathy (PGL), Kaposi's sarcoma, thrombocytopenic purpura, or AIDS-related neuropathic conditions such as AIDS dementia complex, multiple sclerosis or tropical paraparesis, etc. Thus, (3R,3aS,6aR)-hexahydrofuro[2,3-b]furan-3-yl 3-[N-(1,3-benzodioxol-5-ylsulfonyl)-N-isobutylamino]-1-(4-hydroxyphenyl)-2-hydroxypropylcarbamate underwent Mitsunobu reaction with phenethyl alc. using Ph3P and di-tert-Bu azodicarbonate in CH2Cl2 at room temperature for 1.5 h to give 72% I. I showed IC50 of <0.001, <0.001, and 0.01-0.001 μ M against drug-resistant HIV strains, i.e. wild type, mutant HIV-1 EP13, and mutant D545701-14 HIV strains, resp., in MT-4 cells.

AB Prodrugs of a class of sulfonamides which are HIV aspartyl protease inhibitors are described. The prodrugs are characterized by favorable aqueous solubility, high oral bioavailability and facile in vivo generation of the active ingredient. The prodrugs and pharmaceutical compns. of this invention are particularly well suited for decreasing the pill burden and increasing patient compliance in HIV infections. E.g., a pharmaceutical composition, in addition to a prodrug, may comprise an antiviral agent, a HIV protease inhibitor other than a compound of this invention, and an immunostimulant. Thus, title compound (II; R7 = H; R10 = NO2) was heated with H3PO3 and DCC in pyridine to give 96% II (R7 = OP(O)(OH)H; R10 = NO2). This was heated with TMSOOTMS and (TMS)2NH to give 88% II (R7 = OP(O)(OH)2; R10 = NO2). The latter was hydrogenated and salified to give II (R7 = OP(O)(ONa)2; R10 = NH2) (III). III in a methylcellulose/EtOH/H2O formulation administered orally to dogs showed a relative availability of 60.4% relative to its metabolite VS-478.
